

# Your #1 Guide for MAXIMUM Insect Control

## SUMMER IS HERE AND THAT MEANS FLIES ARE, TOO!

As the weather heats up, there is abundant moisture and organic matter available. Flies breed in spoiled/spilled feed, bedding, decaying organic matter and manure. They also prefer moist conditions and decaying organic matter to lay their eggs.

### IMPLEMENT YOUR COMPLETE FLY CONTROL PROGRAM FOR MAXIMUM EFFECTIVENESS

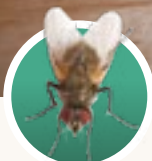

Not only do flies have an economic impact of one billion dollars per year, they can also bring several unpleasant issues. **These issues include reduced weight gains, lower milk production for lactating cows, decreased grazing efficiency, blood loss, anemia and dermal irritation.**

They are known carriers of **Pinkeye**, Anthrax, Brucellosis, TB and **Mastitis**.

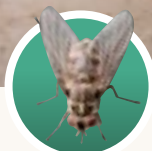

# PROTECT YOUR LIVESTOCK & PROFITS

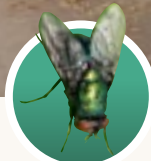

## from flies and other insects

Horn Flies

Stable Flies

House Flies

Lice & Ticks

## Use our helpful comparison charts to create the best total insect control program for your farm

Simply Choose 2-3 METHODS (from list below) for MAXIMUM INSECT CONTROL this year:

- Aerosols
- Pour-Ons
- Sprays & Concentrates
- Scatter Baits
- Feedthroughs
- Tapes, Traps & Ribbons
